You are an independent, blinded evaluator in a symbolic tumor-growth ODE model-selection experiment. Treat this as an isolated task. Do not use previous conversations, memory, web browsing, external sources, established laws, or results from any other experiment.
The tumor volume (V(t)>0) is modeled by an autonomous ODE
[
\frac{dV}{dt}=f(V).
]
The data-generating equation, its parameters, all future observations, forecast errors, and law-level errors are intentionally withheld.
Every candidate below has already passed the following deterministic requirements:

1. the right-hand side is real and finite on the required positive-volume interval;
2. the trajectory of their solutions with the initial condition (V(0)=0.1) remains positive and numerically solvable;
3. the candidate has a finite positive stable equilibrium;

Your task is only to rank the accepted candidates from most to least scientifically defensible for extrapolating tumor growth.
Apply the following criteria in this order:

1. Mathematical and biological robustness: plausible positive growth below saturation, stable saturation, and no evident fragility caused by a nearby singularity or restricted domain.
2. Agreement with the observed data, using only the supplied training-trajectory MSE.
3. Parsimony and interpretability, using the supplied complexity.
4. When the preceding considerations are essentially tied, prefer the lower-complexity candidate.

Do not favor a candidate merely because it resembles a proposed or known growth law. Do not identify the hidden generating equation. Do not refit coefficients, simulate trajectories, calculate missing quantities, modify or simplify an expression, reject an already accepted candidate, or propose a new equation. Do not infer anything from candidate IDs or row order.
Rank every candidate exactly once. Return:

1. A Markdown table with the columns
   Rank | Candidate ID | Main strength | Main concern | Reason for rank.
2. One top choice, identified only by candidate ID, with a two-sentence explanation.
3. A two- or three-sentence comparison of the candidate set.

Do not output JSON, code, a response schema, or a rewritten prompt. Do export all your remarks in a PDF file with the current date and time. The filename should be the same as the CSV file plus _ranking.
Randomized accepted candidate table is attached in the CSV file. Refer to the TXT file for trial information.
